

In the Fulton Market area of downtown Chicago, during the summer months, a 1.5-ton water-cooled spot-cooler was installed inside a retail store area. Being in a high traffic area where doors are opening and closing often can add to your cooling requirements during the summer. The additional solar load from the front windows complicates cooling BTU requirements for supplemental cooling. Various sized units were placed in different store locations to aid in customer comfort and of course employees too. Water lines are neatly routed overhead avoiding trip hazards. Rent AC takes pride in clean, neat and safe installations.
